Listing of Claims:

Claim 1 (Currently Amended): An optoelectronic apparatus for detecting objects in a monitored region comprising:

a transmitter that emits transmission light that is guided into the monitored region, the emitted transmission light being in the form of a sequence of transmission light pulses;

a diverting unit that periodically guides transmission light pulses into the monitored region;

means for coupling out a portion of the light quantity of a transmission light pulse as a reference transmission light pulse so that for each diversion of a transmission light pulse by the diverting unit, a reference transmission light pulse is coupled out of the transmission light pulse;

a receiver that receives reflected light including transmission light pulses reflected by an object in the monitored region and respective reference transmission light pulses which are guided by way of a reference path to the receiver; and

a housing having an exit window wherein the transmitter, the receiver and the diverting unit are situated in the housing so that the transmission light pulses diverted at the diverting unit are guided into the monitored region by way of the exit window; and wherein the coupling-out means is a reflection surface disposed at the exit window, the reflection surface reflecting a portion of the light quantity of the transmission light pulses as the reference transmission light pulse back to the receiver; and

an evaluation unit connected to the transmitter and the receiver, said evaluation unit determining transit time t_o of the reflected transmission light pulse, and transit time t_R of the

respective, reference transmission light pulse guided as a reference reflected light pulse to the

receiver, wherein the transit-time difference to - tR is used to determine the distance of an object.

Claim 2 (Canceled)

Claim 3 (Canceled)

Claim 4 (Canceled)

Claim 5 (Currently Amended): The optoelectronic apparatus according to claim 1 [4], wherein

the reference transmission light pulses are guided entirely inside the housing.

Claim 6 (Previously Presented): The optoelectronic apparatus according to claim 1, further

comprising a light waveguide disposed downstream of the transmitter wherein the reference

transmission light pulses are coupled into the light waveguide and guided via the waveguide to

the receiver.

Claim 7 (Previously Presented): The optoelectronic apparatus according to claim 6, wherein

the reference transmission light pulses are guided entirely inside the housing.

Claim 8 (Currently Amended): The An optoelectronic apparatus according to claim-1, for

detecting objects in a monitored region comprising:

- 3 -

Appl. No. 09/916,231 Amdt. Dated August 29, 2003 Reply to Office Action of May 30, 2003

a transmitter that emits transmission light that is guided into the monitored region, the emitted transmission light being in the form of a sequence of transmission light pulses;

means for coupling out a portion of the light quantity of a transmission light pulse as a reference transmission light pulse;

a receiver that receives reflected light including transmission light pulses reflected by an object in the monitored region and respective reference transmission light pulses which are guided by way of a reference path to the receiver; and

an evaluation unit connected to the transmitter and the receiver, said evaluation unit determining transit time $t_{\rm R}$ of the reflected transmission light pulse, and transit time $t_{\rm R}$ of the respective, reference transmission light pulse guided as a reference reflected light pulse to the receiver, wherein the transit-time difference $t_{\rm o}$ - $t_{\rm R}$ is used to determine the distance of an object and wherein the evaluation unit determines the transit-time difference $t_{\rm o}$ - $t_{\rm R}$ between the reflected transmission light pulse and the respective reference reflected light pulse by quantizing the amplitudes of an analog reflection signal appearing at the output of the receiver, the quantized sequence of reflection signals being read into the individual registers of a memory element at a predetermined rate, and the transit-time difference being determined as the difference between the register positions of the reflected light pulse and the reference reflected light pulse.

Claim 9 (Previously Presented): The optoelectronic apparatus according to claim 8, further comprising a threshold-value unit that converts the analog reflection signals into a binary reflection-signal sequence.

Appl. No. 09/916,231 Amdt. Dated August 29, 2003 Reply to Office Action of May 30, 2003

Claim 10 (Previously Presented): The optoelectronic apparatus according to claim 8, further comprising an analog-digital converter having a word width of n bits that quantizes the analog reflection signals.

Claim 11 (Previously Presented): The optoelectronic apparatus according to claim 10, wherein the analog-digital converter has a word width of 8 bits.

Claim 12 (Previously Presented): The optoelectronic apparatus according to claim 10, wherein the evaluation unit determines the position of the maximum or the center of gravity of one of the quantized reflected light pulse and reference reflected light pulse in order to determine the register positions of the reflected light pulse and the reference reflected light pulse.

Claim 13 (Previously Presented): The optoelectronic apparatus according to claim 8, wherein the memory element is formed by one of a semiconductor memory and a CCD array.

Claim 14 (Previously Presented): The optoelectronic apparatus according to claim 1, wherein the evaluation unit includes a time-measurement module for determining the transit-time difference t_o - t_R , where a reflected light pulse and the associated reference reflected light pulse are read into separate inputs of the time-measurement module.

Appl. No. 09/916,231 Amdt. Dated August 29, 2003 Reply to Office Action of May 30, 2003

Claim 15 (Previously Presented): The optoelectronic apparatus according to claim 14, wherein the inputs of the time-measurement module include a start input and a stop input.

Claim 16 (Previously Presented): The optoelectronic apparatus according to claim 1, wherein the apparatus is used as a safety apparatus in the field of personnel safety, and components of the evaluation unit for determining the transit-time difference t_0 - t_R have a single-channel design.

Claim 17 (New): The optoelectronic apparatus according to claim 1, wherein the reflection surface extends approximately over the width of the exit window so that in each angular position of the diverting unit, the same portion of a transmission light is coupled out due to reflection by the reflection surface.
